HAEMATOLOGY – BONE MARROW ASPIRATION CYTOLOGY

REPORT: -

Differential Count:

Neutrophils – 2.0%;

Lymphocytes - 9.0%;

Eosinophils - 0.0%;

Metamyelocytes – 0.0%;

Myelocytes – 2.0%;

Blasts – 86.0%;

Erythroid cells – 1.0%;

Plasma cells – 0.0%.

Bone Marrow aspiration smears show diluted aproticulate marrow with cell poor trails.

There is diffuse infiltration of the marrow by predominant population of blasts (approx. 86%) having scanty to moderate, bluish, finely vacuolated cytoplasm and hyperchromatic nuclei with 0 – 1 nucleoli. No Auer rods are seen.

Residual haematopoiesis is markedly suppressed.

No haemoparasites seen.

IMPRESSION: - DILUTED MARROW WITH FINDINGS MORPHOLOGICALLY SUGGESTIVE OF ACUTE LYMPHOBLASTIC LEUKAEMIA (? BURKITT'S LYMPHOMA).

Sugg.: - Immunophenotyping for further evaluation.

CLINICAL FINDINGS: - Fever, pancytopenia, bone pains and generalised lymphadenopathy; ?
Acute leukaemia.

NATURE OF SPECIMEN: - A) Trepine biopsy. B) Pre-auricular lymph node Biopsy.

MACROSCOPIC DESCRIPTION: -

- A) Received multiple linear soft tissue fragments aggregating 2.0 cms across, brownish. No bone received. - all.
- B) Received a single nodular soft tissue fragment measuring 1.5 cms across. C/s is tan brown and rubbery. - 3 all.

MICROSCOPIC DESCRIPTION: -

- A) Section show fragments of blood clots without any bony trabeculae. Blood clots show monomorphic sheets of blasts having scanty to moderate cytoplasm and hyperchromatic nuclei with 0 - 1 nucleoli. Auer rods are not seen. Residual haematopoiesis is markedly suppressed.
- B) Section shows fragments of lymph node, showing complete effacement of the nodal architecture replaced by diffuse sheets of predominantly medium sized atypical lymphoid cells interspersed with lymphocytes and histiocytes. No RS - like cells are seen. There is evidence of peri-lymphadenitis.
